

Project overview

Project: NovaMart Sales Analysis

Objective: Novamart is an end-end Analysis of sales performance and identification of revenue trends developed using MySQL and PowerBI.

Tools: Made use of MySQL, SQL, Power BI, Excel/CSV.

Dataset: 10,000 sales transactions, 500 customers, 120 products, 20 salesreps, and 30 suppliers

PROCESS

1. Data: My data has four relational tables which includes;

- Suppliers Table
- Products Table
- Customer Table
- Sales Table.

2. SQL Analysis: Calculated the following using SQL;

- Total Revenue: ₦11.18B
- Quantity Sold: 30K
- Total Transactions: 10K
- Average Order Value: ₦1.12M
- Unique Customers: 500

3. Insights: My analysis provided answers to the following business questions just by looking at the visuals;

- What is the total revenue?
- What are the monthly revenue trends?
- Which products generate the most revenue?
- Which sales representatives perform best?
- Which cities generate the most revenue?
- Which payment methods are most commonly used?

Providing answers to questions like these helps in making solid business decisions like which product should be restocked, products to stock more,

which salesrep deserves better incentives, which customer should be prioritised for loyalty programs, and how to improve on payment method mostly used by customers.
